

The Global Positioning System (GPS) is a location and navigation tool that has evolved from a military targeting tool in the 1980's to a low-cost consumer navigation technology used everywhere today.

Our experience dates to the early 1990's when the rapidly evolving technology was emerging from military applications to create the civilian survey and geospatial market.

Our staff were among the original designers to integrate GPS with GIS and revolutionize the field data collection of GIS features with GPS accuracies.
